PROLEPSIS

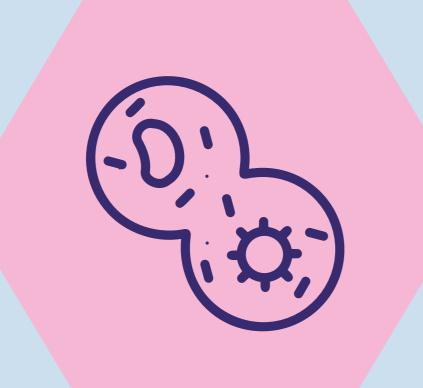

Psoriatic Arthritis inflammation explained through multisource data analysis guiding a novel personalised digital care ecosystem

Psoriatic Arthritis (PsA) is a chronic, progressive, inflammatory disease affecting 1-2% of the general population, while manifesting

in up to 30% of people with psoriasis (PsO).

KEY OBJECTIVES

Discover PsA inflammation drivers and the role of omics, biological and environmental data Develop ICT-based personalised interventions to sustain or improve the quality-of-life

Develop AI-based technologies for PsA early detection, symptoms monitoring and disease activity prognosis Co-create the iPROLEPSIS ecosystem with key stakeholders following ethical, inclusive and trustworthy AI principles

ACKNOWLEDGMENT: iPROLEPSIS received funding from the European Union ion under Grant Agreement No. 101095697.
